

SOSMonitor, one of the modules comprising InsightAtlas's *SOSMobile* suite, automatically creates orders from incoming email and auto-attaches electronic files to existing orders.

Why *SOSMonitor*?

Is someone at your utility spending valuable time creating orders from 811 notifications? Or, perhaps manually creating orders from forms on your Web site, such as energy audit requests? *SOSMonitor* can automate the process. It's designed to monitor specified incoming email, parse the pertinent information, and convert it into electronic orders. These orders can then be scheduled, assigned and closed in the field like any other. *SOSMonitor* also allows images or documents to be attached to existing orders on-the-fly using any email capable device—no *SOSMobile* software required.

Contact us to discuss the automation possibilities!

SOSMobile

Intelligently Automating Your Utility's Mobile Workforce

SOSMonitor Feature Highlights

- ◆ Easily implemented.
- ◆ FSRs can email images or signatures to an order with their own device — no *SOSRemote* software required.
- ◆ Orders are stored in the *SOSMobile* server—no integration to existing systems required.
- ◆ A great way to introduce your mobile workforce automation project.

“ *SOSMonitor is just one more way the SOSMobile product line has increased efficiency for us. Being able to store Dig Safe requests within SOSMobile is great. We were able to avoid a custom modification request from our CIS vendor which would have prolonged the implementation. Instead we were up and running in no time.* ”
